

A physical modeling kit that turns roadway planning into a **hands-on, creative experience**.

SnapStreets builds roadway cross-sections the way you draw them — element by element, curb to curb. Every module carries its own label on the face, so a finished model reads like a typical section: **Sidewalk · 10' Road · 10' Road · Danish · 10' Road · 10' Road · Sidewalk**.

Use it at an open house to let people rebuild the street in front of them, at a design charrette to test a lane reallocation in seconds, or on a desk to explain why a 12-foot shoulder and a 10-foot lane are not the same trade.

A completed model — center-running bus lanes between general purpose traffic, with protected bike lanes behind each curb.

Anatomy of a section

Pedestrian safety configuration, exploded. Deck modules carry their own labels; markings sit in the joints or on the surface; verticals plug in from above.

Build a cross-section in five steps

1. Lay the deck

Start at one curb and snap the roadway modules edge to edge, in the order the cross-section reads.

2. Drop in the stripes

Solid and dashed stripes fit into the joints *between* modules. Move a stripe and you have moved a lane line.

3. Set the median

Add a raised median, a Danish crossing or a concrete barrier at the centerline.

4. Snap on the surface

Turn arrows, crosswalks and bicycle buffer striping press onto the face of a road section.

5. Plug in the verticals

Lighting, signals, signs, soundwalls, shelters and trees drop into the sockets — any vertical fits any socket.

Read the model like a plan sheet

The label on each module is the element it represents, not the size of the plastic — and every module carries its real-world width (parts key, side 2). Read the faces left to right and you have the section call-out; add the widths and you have the roadway. Flip a **Fill** wedge over and it becomes a **Cut** — the same piece works on either side of the grade line.

Parts key

Roadway modules	DECK	Markings	SNAP ON	Vertical elements	PLUG IN
Sidewalk	Sidewalk 10' — curb, gutter and walk; the end module of an urban section	solid	Solid stripe, yellow — centerline or left edge line; fits the joint between modules	<i>light</i>	Cobrahead light — highway and arterial luminaire
10' Road	Road section, urban 10' — general purpose travel lane	solid	Solid stripe, white — right edge line and channelization	<i>light</i>	Ornamental light — pedestrian scale, single or twin arm
12' Road	Road section, highway 12' — freeway travel lane	dashed	Dashed stripe, white — lane line between travel lanes	<i>light</i>	Decorative street light — twin arm, urban street
Shldr	Shoulder 6' — inside and outside shoulders	<i>arrow</i>	Turn arrow — presses onto the face of a road section	<i>signal</i>	Traffic signal, mast arm — signal heads with warning signs
Danish	Center median, Danish crossing 10' — offset pedestrian refuge	<i>crosswalk</i>	Crosswalk — ladder-style bar pattern; snaps across road sections	<i>signal</i>	PHB crossing signal — pedestrian hybrid beacon assembly
Med	Center median 4' — narrow raised separation	<i>buffer</i>	Bicycle buffer striping — hatched buffer, snaps over the roadway beside a bike lane	<i>sign</i>	Gantry sign — overhead sign bridge with oversized interstate shield
Bike	Bike lane 4.5' — green surfaced lane or cycle track	<i>barrier</i>	Highway barrier — concrete median barrier; seats in the center joint	<i>wall</i>	Soundwall — noise wall panel and post
Bus	Bus stop concrete 12' — concrete pad at the curb	Scale & labeling		<i>transit</i>	Bus shelter — canopy for the boarding island
Shelter	Shelter median 10' — boarding island that receives the shelter	<i>width</i>	Every deck module has a nominal width in feet , printed in red above. Add them across to get the section width.	<i>landscape</i>	Tree — canopy on a trunk; sets the street tree line
Bus	BRT running way 12' — bus rapid transit lane; runs center or side	<i>joints</i>	Stripes live between modules; arrows, crosswalks and buffers live on them.	<i>landscape</i>	Bush — low shrub for planter strips and medians
Fill	Fill / Cut — earthwork wedge; flip it over for a cut	<i>sockets</i>	Every deck module carries sockets on top — any vertical fits any socket.	Brick compatible	
Ditch	Ditch — median or roadside drainage	HOW TO READ IT		ALSO FITS	

The studs on every SnapStreets module are **standard toy-brick size**, so parts from any compatible brick system snap straight on — figures, vehicles, buildings. Stand a few people in the crosswalk and the section stops being abstract.

Four configurations to build

Pedestrian Safety

2 LANES + REFUGE

Sidewalk 10' Road 10' Road Danish 10' Road 10' Road Sidewalk

Section width **70'** back of walk to back of walk · 50' curb to curb

Add: PHB crossing signal, crosswalks across both approaches, ornamental lights, trees and bushes.

Cycle Track

4 LANES + PROTECTED BIKEWAY

Sidewalk 10' Road 10' Road 10' Road 10' Road Bus Shelter Bike Bike

Sidewalk

Section width **91'** back of walk to back of walk

Add: bus shelter on the median, turn arrows, decorative twin-arm lights, trees and bushes.

Bus Rapid Transit

CENTER RUNNING

Sidewalk Bike Med 10' Road 10' Road 10' Road 10' Road Med Bus Bus

Shelter 10' Road 10' Road 10' Road Bike Sidewalk

Section width **141'** back of walk to back of walk

Add: BRT shelter on the center median, bicycle buffer striping, turn arrows, cobrahead lights.

Highway

DIVIDED, 4 LANES

Fill Shldr 12' Road 12' Road Shldr Ditch Shldr 12' Road 12' Road Shldr Fill

72' of paved roadway — 36' each direction, plus ditch and slopes

Add: concrete barrier at the median, gantry sign with interstate shield, soundwalls behind each fill slope, cobrahead lights.
